2 Parameter remarks

Nr.	Remark
1	Defrost is not performed twice in case safety switches of mc or evaporator are not ok.
2	The period of each cycle includes on-time + off-time, that is the overall duration of the cycle.
3	Following defrost cycles will be aligned to the end of forced one.
4	Add 100 to FPt parameter to enable the outer defrost drive on INP-4. The defrost is initiated by INP-4 closure; after defrost and until INP-4 is closed, the instrument does not leave the dripping mode, to coordinate with eventual other instruments.
5	In case of hot gas defrost, both IA2 and IA3 must reach Ftt.
6	When MLH<MLL,there is a delay of 10*(MLL-MLH) seconds on lp switch. Eventual pumpdown restart is over MLH+1 bar.
7	Fixed time 120 s and manual reset.
8	When activated, pump down mode forces compressor continuous run, switched off only by low pressure limit.
9	Forced refrigeration is disabled when room temperature is under LFL, forced heating is disabled over LFH.

Nr.	Remark
10	When speed regulation is off the fan is operated on-off.
11	Caution! Speed regulation can cause fan fault or electronic board fault. Low and average minimum speed can increase the risk.
12	During the first 10 seconds of speed regulation, the n1L is replaced by (n1H+n1L)/2.
13	No action if the light is switched on from inside the room.
14	When off, the refrigeration solenoid is steadily on during cooling, as long as overheating is higher then vtL or b3A is off.
15	Caution! Low overheating causes liquid return and compressor damage.
16	Overheating over the maximum forces valve anticipated opening.
17	Overheating under the minimum delays valve opening.
18	Caution! Short duty cycle reduces valve life.
19	Caution! Low overheating causes liquid return and compressor damage.
20	Caution! High adaptation speed causes swing in the suction line and damage to the compressor.
21	In H422V9, starting from revision 14, when b1A is on, b4A is off, and b4C is non-zero, use AN-4 reading with set at 0.0 °C + b4C to concur for low temperature alarm and to stop cooling.
22	The low temperature differential is fixed, and alarm status stops at 0.2 °C above the set point.
23	The high temperature differential is fixed, and alarm status stops at 0.2 °C under the set point.
24	Passing from stand-by to on and at power on, there is a 5 second delay spent in a virtual stand-by.
25	The minus sign on display ("-") signals that output is going to start after a delay.
